

Asset Management Solution (AMS)

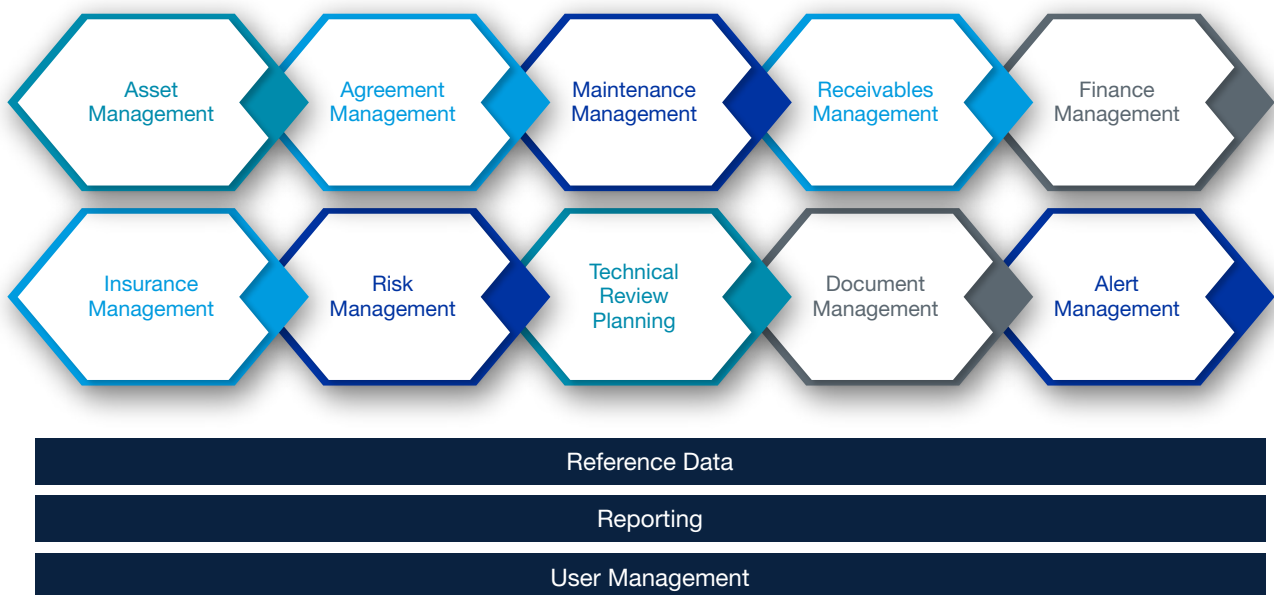

Effective and proactive data administration is critical in managing and maintaining the value of an aircraft. For successful asset management, lessors and investors require fleet agnostic tools and services that provide all necessary capabilities in a single application.

Asset Management Solution (AMS) uses the latest cloud and web-based technologies to provide complete asset and lease management capabilities throughout asset lifecycles. This application supports the management of airplanes, engines, and other categories of leased assets, whether on-or off-lease.

AMS provides specially designed tools and workflows to enable effective and efficient management of assets and contractual obligations as well as risk management. This support is offered by bringing related parts of asset management together including technical, maintenance, legal, accounting, and risk functions.

AMS is a tiered offering, with each tier building upon the previous tier, to provide comprehensive capability based on your needs. The application provides complete integrated modules that enable you to increase efficiency and functionality. These modules are completely integrated within the application to provide effective management of leased assets. These modules include:

AMS is built on the same platform as Records Management Solution, enabling sharing of common modules such as Assets Management and User Management for easy administration.

AMS is accessed from the Leasing Dashboard, a single-point solution for the leasing community, enabling integration and data sharing with other key applications needed to manage leased assets and lease transitions. It is a workspace and a launch point for all necessary integrated applications, and provides KPIs as well as links to other information. Through APIs, AMS can also be integrated with third-party solutions.

AMS Back Office Services

We understand that populating and managing information on a day-to-day basis is time consuming and needs resources. AerData, a Boeing Company, provides AMS Back Office Services that enable you to outsource manual work to us while you make use of your time making important decisions. The service includes populating asset, contract and maintenance reserve information. It also includes ongoing back office services, collecting utilization data from operators and invoicing them on your behalf, administrating asset change, contracts, claims and more.
